

Session 1

Preliminaries and Languages

Central Concepts

- Alphabets
- Strings
- Languages
- Representation
- Interpretation
- Problems

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003

Alphabets

- A finite (nonempty) set of symbols: Σ
 - $\Sigma = \{a, b, c, \dots, z\}$
 - $\Sigma = \{\alpha, \beta, \gamma, \dots, \omega\}$
 - $\Sigma = \{0, 1\}$
 - $\Sigma = \{0, 1, 2, 3, \dots, 9\}$
 - $\Sigma = \{1\}$
 - Σ = The set of ASCII characters

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003

Strings

- A string (a word) over an alphabet Σ
 - A finite sequence of symbols of Σ
- Length of a string
 - The number (positions) of symbols in a string:
 - $w = "111"$ has one symbol in three positions
 - The length of string w is $|w|$
 - $|w| = 3$
- The null string: Λ (lambda)
 - Λ may be chosen from any alphabet
 - $|\Lambda| = 0$

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003

Strings

- Notation:
 - Lower-case letter at the beginning of the alphabet denote symbols: a, b, c, \dots
 - Lower-case letters at the end of the alphabet denote strings: w, x, y, z

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003

Strings

- Powers of an alphabet
 - If Σ is an alphabet Σ^k is the set of strings of length k , such that all symbols in k are in Σ
 - $\Sigma^0 = \{\Lambda\}$
 - If $\Sigma = \{0, 1\}$ then
 - $\Sigma^0 = \{\Lambda\}$
 - $\Sigma^1 = \{0, 1\}$
 - $\Sigma^2 = \{00, 01, 10, 11\}$ and so on
 - $\Sigma \neq \Sigma^1$ (Σ is the alphabet and Σ^1 is the set of strings of length 1)

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003

Strings

- For any alphabet Σ the set of *all* strings over Σ is denoted as Σ^*
 - $\Sigma^* = \Sigma^0 \cup \Sigma^1 \cup \Sigma^2 \cup \dots$
 - $\Sigma^* = \{0, 1\}^* = \{\Lambda, 0, 1, 00, 01, 10, 11, \dots\}$
- And without Σ^0 :
 - $\Sigma^+ = \Sigma^1 \cup \Sigma^2 \cup \dots$
 - $\Sigma^+ = \{0, 1\}^+ = \{0, 1, 00, 01, 10, 11, \dots\}$

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003

Σ^* is denumerable

- A set is *denumerable* or *enumerably infinite* or *countable* if it can be arranged in a single (perhaps infinite) list:
 - 1, 2, 3, 4... is an infinite list
 - 1, 3, 5, ..., 2, 4, 6... is not! ($\infty + 1$?)
 - We need to be able to tell for each object listed, which one is it on the list
- A set A denumerable if there is a function with domain in N (the natural numbers) such that each member of A is associated to one n in N

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003

Σ^* is denumerable

N	Σ^*
1	Λ
2	0
3	1
4	00
5	01
6	10
7	11
8	000

N	Σ^*
9	001
10	010
11	011
12	100
13	101
14	110
15	111
16	...

$$\Sigma^* = \{0, 1\}^* = \{\Lambda, 0, 1, 00, 01, 10, 11, \dots\}$$

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003

Σ^* is denumerable

- $\Sigma = \{a, \dots, z\}$ (26 letters)
 - Σ^0 has 1 string of length 0 (i.e. Λ)
 - Σ^1 has 26 strings of length 1 (i.e. a, \dots, z)
 - Σ^2 has 26^2 strings of length 2 (in alphabetic order)
 - Σ^3 has 26^3 strings of length 3 (in alphabetic order)
 - ...
- There is a function that for any argument n the value is the corresponding string in Σ^*

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003

Strings

- Concatenation of strings
 - If x and y are strings xy denotes the concatenation of x and y
 - More precisely: if $x = x_1x_2 \dots x_i$ and $y = y_1y_2 \dots y_j$ then $xy = x_1x_2 \dots x_iy_1y_2 \dots y_j$
 - i.e.: $x = 01101$ and $y = 110$ then $xy = 01101110$
 - $|xy| = i + j$
 - Identity of concatenation: $\Lambda x = x \Lambda = x$
 - Concatenation is associative: $(xy)z = x(yz)$

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003

Strings

- Concatenation of sets of strings
 - If $A, B \subseteq \Sigma^*$ the concatenation of A and B is

$$AB = \{xy \mid x \in A \text{ and } y \in B\}$$
- Concatenation is NOT commutative
 - $A = \{a, b\}$ and $B = \{c, d\}$
 - $AB = \{ac, ad, bc, bd\}$
 - $BA = \{ca, cb, da, db\}$

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003

Concatenation of strings

$$AB = \{xy \mid x \in A \text{ and } y \in B\}$$

d	ad	bd
c	ac	bc
$\begin{array}{c} B \\ \hline A \end{array}$	a	b

Different from $BA = \{ca, cb, da, db\}$

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003

Strings

• However:

- $\Sigma^{n+1} = \Sigma \Sigma^n = \Sigma^n \Sigma \quad (\Sigma = \Sigma^1)$
- If $\Sigma = \{0, 1\}$ then
 - $\Sigma^0 = \{\Lambda\}$
 - $\Sigma^1 = \{\Lambda\} \{0, 1\} = \{0, 1\} \{\Lambda\} = \{0, 1\}$
 - $\Sigma^2 = \{0, 1\} \{0, 1\} = \{00, 01, 10, 11\}$
 - $\Sigma^3 = \{0, 1\} \{00, 01, 10, 11\} = \{00, 01, 10, 11\} \{0, 1\}$
 $= \{000, 001, 010, 011, 100, 101, 110, 111\}$
 - ...

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003

Languages

- A *language* is a set of *strings* made out of symbols of an *alphabet*
- Natural languages (English, Spanish, etc.)
 - Syntactic level: Sentences are made out of words
 - Lexical level: Words are made out of symbols of an alphabet
- Formal languages
 - Syntactic level: Well-formed expressions are made out strings (tokens)
 - Lexical level: tokens are made of alphabet symbols (ASCII)

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003

Definition of Languages

- A language over Σ is a subset of Σ^*
- L is a language over Σ if $L \subseteq \Sigma^*$
- L needs not to include all symbols in Σ , so if L is a language over Σ , it is also a language over a super set of Σ

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003

Examples of Languages

- The language of all strings consisting of n 0's followed by n 1's, for some $n \geq 0$:
 $\{\Lambda, 01, 0011, 000111, \dots\}$
- The set of strings of 0's and 1's with an equal number each:
 $\{\Lambda, 01, 10, 0011, 0101, 1001, \dots\}$
- The set of strings representing prime numbers in binary notation:
 $\{10, 11, 101, 111, 1011, \dots\}$

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003

Examples of Languages

- Σ^* is a language over any alphabet
- Φ , the empty language, is a language over any alphabet
- $\{\Lambda\}$, the language consisting of the empty string
- Note that $\Phi \neq \{\Lambda\}$

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003

Stating a language

- As set formation:
 - $\{w \mid \text{a property of } w\}$
 - Example: $\{w \mid w \text{ consists of a sequence of } n \text{ 0's followed by a sequence of } n \text{ 1's}\}$
- Expressing w with parameters
 - $\{0^n 1^n \mid n \geq 0\}$ where n is the parameter
 - $\{0^i 1^j \mid 0 \leq i \leq j\}$ where i and j are the parameters
- Combining set operators with concatenation
 - $\{ab, bab\}^* \cup \{b\} \{bb\}^*$
- Or even:
 - $\{byb \mid y \in \{a, b\}^*\}$
- It would be nice to have a simple and clear way to do it!

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003

Representation

- Strings in languages *represent* objects in the world:
 - John, Pete and Luis are represented by $\{john, pete, luis\}$
 - 2, 3, 5, 7, 11 are represented by $\{10, 11, 101, 111, 1011, \dots\}$
- A representation can be thought of as a function from the world to a language!
- This function is applied by the sender of a message!

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003

Interpretations

- Strings in languages are *interpreted* as objects in the world:
 - $\{john, pete, luis\}$ are interpreted as John, Pete and Luis
 - $\{10, 11, 101, 111, 1011, \dots\}$ are interpreted as 2, 3, 5, 7, 11
- A interpretation can be thought of as a function from the language to the world!
- This functions is applied by the receiver of the message!

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003

Problems

- A *problem* is the question of deciding whether a string is a member of some particular language
- If Σ is an alphabet, L is a language over Σ , the problem L is:
 - Giving a string w in Σ^* , decide whether or not w is in L
- Problems and Languages are really the same thing!

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003

A Problem

- The problem of whether a number is prime can be expressed by the language L_p consisting on all monadic strings whose length is a prime number:
 - $L_p = \{11, 111, 11111, 1111111, 1111111111, \dots\}$
 - $111 \in L_p$
 - $1111 \notin L_p$
- Given a string of 1's say "yes" or "not" depending the string in question represents a prime
- We need to think of the language as a representation; otherwise we cannot define the algorithm

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003

Problems

- Two ways of think of Problems:
 - As decision questions: Deciding whether a string is in a set of strings
 - $111 \in \{11, 111, 11111, 1111111, 1111111111, \dots\} ?$
 - As procedures transforming an input into an output:
- Question of complexity theory:
 - Executing an algorithm will take some computational resources: space and time
 - If a problem is *hard* it can be *reduced* to an equivalent but simpler formulation

Dr. Luis Pineda, IIMAS, UNAM, Mex. & OSU-CIS, USA, 2003
